

Q4: If  $H$  is a  $p$ -subgroup that contains  $N$ , then the fourth isomorphism theorem tells us that  $H/N$  will be a  $p$ -group of  $G/N$ . If  $H \leq N$  is a  $p$ -group of  $G$ , then every element of  $H/N$  will be sent to  $eN$  by the projection mapping. Hence there can be at most  $n_p(G)$   $p$  groups in  $G/N$ . Therefore  $n_p(G/N) \leq n_p(G)$ . If  $N = \{e\}$ , then we have that  $n_p(G) = n_p(G/N)$ , so the inequality may not be strict.
